

Vertical Steel Barrel Clamp

- 500kg Capacity
- Simple operation
- Minimises operator error
- 100% Positive Grip on Barrel

A unique design specifically developed for the offshore industry. It is simple to use and reduces any possible chance of operator error to a minimum. The clamps engage over 50% of the barrel rim and provides 100% positive grip throughout all lifting operations.

The clamp is opened using the hand tensioner and placed over the barrel and then tightened under the rim and the 4 leg chain sling attached to the crane hook and the barrel lifted to the required location.

Our clamp design incorporates several fundamental safety features one of which is its secondary tightening action that automatically occurs when the barrel load is transferred to the lifting sling. This action ensures that the deflection / distortion of the barrel under its self weight is compensated for by the clamp.

The unit has a 500kgs Swl and is supplied with a 4 leg chain sling assembly, Load Test & NDT certification and Painting to Offshore Specification.
